

Android private key required to install certificate

Continue

Microsoft allows anyone to download Windows 10 for free and install it without a product key. It'll keep working for the foreseeable future, and you can even pay to upgrade to a licensed copy of Windows 10 after you install it. Whether you want to download Windows 10 in Boot Camp, put it on an old computer that isn't eligible for a free upgrade, or create one or more virtual machines, you don't actually need to pay a cent. Update: 7/18/22: We've reviewed this article and confirmed that it still works for the latest version of Windows 10. How to Download Windows 10 and Install it Without a Key RELATED: Where to Download Windows 10, 8.1, and 7 ISOs Legally First, you'll need to download Windows 10. You can download it directly from Microsoft, and you don't even need a product key to download a copy. There's a Windows 10 download tool that runs on Windows systems, which will help you create a USB drive to install Windows 10. If you aren't on Windows, you can visit the Windows 10 ISO download page to download an ISO directly (say, if you're installing Windows 10 in Boot Camp on a Mac). If you visit that page on a Windows machine, it'll redirect you to the download tool page instead. Just begin the installation process and install Windows 10 like you normally would. One of the first screens you'll see will ask you to enter your product key so you can "Activate Windows." However, you can just click the "I don't have a product key" link at the bottom of the window and Windows will allow you to continue the installation process. You may be asked to enter a product key later in the process, too — if you are, just look for a similar small link to skip that screen. If you don't see this option, you can also provide a KMS client setup key to continue. These keys won't give you an activated copy of Windows unless you're in an organization with a Key Management Service, but they will allow you to get through the Windows installation process. When you select this option, you'll be able to install either "Windows 10 Home" or "Windows 10 Pro." Bear in mind that, if you plan to pay to upgrade to the paid version later, it'll be cheaper to upgrade to Windows 10 Home, so you may want to install the Home version. Whatever version you choose, Windows 10 will install normally. The Cosmetic Limitations RELATED: How Does Windows Activation Work? After you've installed Windows 10 without a key, it won't actually be activated. However, an unactivated version of Windows 10 doesn't have many restrictions. With Windows XP, Microsoft actually used Windows Genuine Advantage (WGA) to disable access to your computer. These days, Windows just complains at you in a few minor, cosmetic ways. Initially, you won't notice a difference. Eventually, Windows will start nagging you a tiny bit. First, you'll notice a watermark in the bottom-right corner of your screen. You'll also see a "Windows isn't activated. Activate Windows now," link at the bottom of the Settings app. This is the only form of nag you'll see — there are no pop-up windows, for example. Second, you'll be unable to change your desktop wallpaper and from the Personalization > Background screen in the Settings app. You'll see a "You need to activate Windows before you can personalize your PC" message at the top of this window, and the options for changing your wallpaper will be grayed out. You can still change your wallpaper in other ways, however. For example, you can right-click an image in File Explorer and select "Set as desktop background." You could also open an image in the Photos app, click the menu button, click "Set as," and click "Set as background." Windows 7 eventually switched you back to a black background, but Windows 10 doesn't seem to do this. You'll find Windows 10's included wallpapers under the C:\Windows\Web folder in File Explorer. Aside from these basic limitations, your Windows 10 system will continue to work forever. There are no nag prompts aside from the watermark, you'll get all the system updates, and everything else is completely functional. The only thing that could change this is a Windows 10 update, but Microsoft has become increasingly lenient since Windows 7. How to Upgrade Windows 10 to an Activated Version With Windows 10, you can now pay to upgrade a "non-genuine" copy of Windows to a licensed one. Open the Settings app and head to Update & Security > Activation. You'll see a "Go to Store" button that will take you to the Windows Store if Windows isn't licensed. In the Store, you can purchase an official Windows license that will activate your PC. The Home version of Windows 10 costs \$120, while the Pro version costs \$200. This is a digital purchase, and it will immediately cause your current Windows installation to become activated. You don't need to purchase a physical license. We installed Windows 10 Professional as an example here, so the Windows Store will only let us purchase the \$200 Windows 10 Pro license. This option may not be available in all countries. The prices here are for the US version of the Windows Store. Microsoft charges different prices in different countries and currencies. Windows 7, 8, and 8.1 worked about the same way. Microsoft just didn't officially allow you to download Windows without a product key, and there was no way to fully upgrade to a licensed system from within Windows. That makes this all the more tempting with Windows 10 — for example, you can install Windows 10 in Boot Camp on your Mac for free and, if you find yourself using it frequently, you can quickly pay to remove the watermark if that's worth it for you. It's like a free demo, and you can use it to make all the virtual machines you like for testing purposes. Sure, the license agreement may say you're not supposed to use it without a key, but Microsoft's license agreements say all sorts of confusing things. Microsoft's license agreement still forbids using the popular "OEM" copies of Windows 10 on PCs you build yourself. If Microsoft doesn't want people using unactivated copies of Windows 10 for extended periods of time, it can release a system update that disables this. (Image credit: Google/Android) The Android 11 (opens in new tab) beta is out now for Pixel and OnePlus 8 (opens in new tab) owners to play with, but not all of the features early adopters are enjoying will reach every handset. XDA Developers (opens in new tab) has got a hold of the Compatibility Definition Document (CDD) which details what features Google insists manufacturers adopt. If a manufacturer ignores the compulsory features, then Google apps can't be included and a third party suddenly finds itself in a voluntary Huawei-style position: not ideal. But there's a second class of feature, which is semi-optional. These are marked as "strongly recommended", and the leak shows three big Android 11 features which get this treatment, meaning there's a chance that your next Android smartphone won't support them.First up: Device Controls.This is the feature of Android 11 that lets you control smart home devices, such as lights and thermostats, via a long press of the power button. Interestingly, XDA Developers notes that this was originally in the compulsory category, but was relegated to optional by May. Perhaps third parties were concerned that users would be confused by adding extra functionality to the on/off button.Conversations is the second Android 11 feature that's optional. With this feature, notifications from messaging apps are grouped together in the notifications bar above all other alerts. The idea here is to ensure that messages aren't lost in a sea of app alerts. But once again, this is optional, and probably a tacit acknowledgement that the notification panel is one of the main areas that OEMs customize their Android experience.Finally, there's the IdentityCredential API. This is a system that lets Android 11 safely store forms of ID — such as your driving licence — on your phone, in a secure offline environment. The XDA Developers reports that this was demoted from essential to optional on March 18, and posits that this relaxing of the rules might be down to how difficult it is to implement. In other words, while it's not essential now, it might be by the time Android 12 rolls around.It's important to note that just because OEMs aren't forced to implement these Android 11 features, it doesn't mean that they won't. While these are hardly the big headline improvements with Android 11, there's such precious little difference between handsets that we'd imagine manufacturers would be loathe to omit features, and potentially give an advantage to their rivals.For those not currently in the Android 11 beta, highlights include new media controls, chat head bubbles and screen recording. Check out our Android 11 hub for the lowdown on all of the biggest new features. More: Stay protected with the best Android VPN You should always use 2-factor authentication, or 2-step verification as Google calls it. This is the best way to keep unauthorized people from getting into your accounts, but it can be a pain to set up and use. That's why Google has worked to make 2-step verification easier to use with devices like the Titan Security Key. That costs money, and you might already have an Android phone. Starting now, most Android phones have magically become 2-factor security keys. Most 2-factor security keys are USB dongles, so you need to find a free port on a device and plug the hardware in. As we move from USB-A to Type-C, you may or not have the right kind of port available. Google's Titan key solves that with Bluetooth support, and now Android phones operate in a similar fashion. You need Bluetooth and location services enabled, though. Phone security keys can be configured on any device running Android 7.0 Nougat or higher. This feature was delivered by a Google Play Services update, so you don't need any system OTAs. When you attempt to log into Google, your phone will generate a confirmation prompt. The Pixel 3 and 3 XL have a hardware Titan M security chip inside, so you have to press the volume down button to physically engage the chip. All other phones have a button on the screen to authorize.Currently, you can use your phone authenticator over Bluetooth with a computer running Chrome OS, macOS, or Windows 10 with the latest stable version of Chrome (v72 as of this writing). You also need the same Google account signed in on both devices. Google is working to get the industry to standardize around the FIDO and WebAuthn standards, but support is somewhat narrow at this time. The argument could be made that using your phone as an authenticator is a bit less secure than using an app like Google Authenticator to generate one-time codes. After all, someone just needs to tap a button within Bluetooth range of the login. However, Google only lets you set up phones as authenticators as long as you have a secure lock screen enabled. Turning on trusted locations or devices that can bypass the lock screen (a long-time feature of Android) reduced your security.Now read:
